Background

Nucleoside diphosphate kinase (NDK) exists as a hexamer composed of &Apos;A&Apos; (encoded by NME1) and &Apos;B&Apos; (encoded by this gene) isoforms. Multiple alternatively spliced transcript variants have been found for this gene. Read-through transcription from the neighboring upstream gene (NME1) generates naturally-occurring transcripts (NME1-NME2) that encode a fusion protein comprised of sequence sharing identity with each individual gene product.
